

Aviator Core Framework

TxMQ's Aviator Core Framework makes it easier for developers to build DLT applications using the Swirlds SDK.

- Event-driven application programming model
- REST and Web Socket integration
- Blockchain-based transaction logging and history
- Designed to be familiar to developers with an enterprise Java background. If you know what an annotation is and can run a Maven build, you can develop applications with Aviator Core Framework.

Pipeline Programming Model

Aviator applications are developed using an event-driven programming model called the pipeline. Every transaction follows the same pre-determined event flow.
